17.13 Acute Glomerulonephritis in Children*

Assessment	Nursing Diagnosis	Plan / Expected Outcome	Nursing Interventions	Evaluation
Subjective • Mother says, "His urine is dark like tea." **Objective** • Hematuria; puffy eyes • BP 130/90 mmHg • Low urine output	**ACTUAL** Excessive fluid volume related to reduced glomerular filtration as evidenced by edema, hypertension and oliguria.	• Normal BP and urine output within 1 week.	• Weigh daily; keep a strict intake and output chart. • Restrict fluid and salt as prescribed. • Measure BP every 4 hours. • Give the antihypertensive as ordered.	• Goal reached when BP and output are normal.
Subjective • Mother asks, "Can he eat normally?" **Objective** • Cannot state the dietary limits	**ACTUAL** Inadequate health knowledge [parental] related to dietary restrictions as evidenced by questioning.	• Parent describes the salt and fluid limits.	• Explain the salt and fluid limits. • Explain how recovery usually goes.	• Met when the limits are described.
Subjective *No specific complaint* **Objective** • BP 140/95 mmHg	**RISK** Risk for ineffective cerebral tissue perfusion as evidenced by risk factors: severe hypertension (encephalopathy).	• No neurological complications.	• Report headache, vomiting, visual change or seizures. • Check BP.	• Achieved if no complication occurs.
