15.15 Induction of Labor*

Assessment	Nursing Diagnosis	Plan / Expected Outcome	Nursing Interventions	Evaluation
Subjective • "Why do I need induction?" • "Will it hurt more?" **Objective** • 41 weeks, post-term • Cannot describe the process	**ACTUAL** Inadequate health knowledge related to the induction procedure as evidenced by questioning.	• Can say why induction is needed and what to expect.	• Explain the reason and the methods: prostaglandin, amniotomy, oxytocin. • Explain the monitoring and roughly how long it may take. • Obtain consent per policy.	• Outcome reached when she shows understanding.
Subjective • Rates contraction pain 7/10 **Objective** • Oxytocin infusion • Contractions every 3 minutes	**ACTUAL** Labor pain related to induced uterine contractions as evidenced by pain score and contractions.	• Copes with contractions using the pain relief she has chosen.	• Talk through the pain-relief options. • Support her breathing and positioning. • Assess pain regularly.	• Considered met when she is coping.
Subjective *No specific complaint* **Objective** • Oxytocin infusion	**RISK** Risk for impaired maternal-fetal dyad as evidenced by risk factors: uterine hyperstimulation from oxytocin.	• No more than 4–5 contractions in 10 minutes, with a normal fetal heart.	• Run oxytocin by pump and adjust it only per protocol. • Keep contractions and fetal heart on continuous monitoring. • Stop oxytocin and call the physician if there is hyperstimulation or an abnormal fetal heart.	• Goal reached when contractions and fetal heart are normal.
