5.8 Status Epilepticus*

Assessment	Nursing Diagnosis	Plan / Expected Outcome	Nursing Interventions	Evaluation
Subjective *No specific complaint* **Objective** • Seizure lasting more than 5 minutes • SpO_2 85% • Cyanosed	**ACTUAL** Ineffective airway clearance related to continuous seizure activity as evidenced by cyanosis and low SpO_2.	• Airway maintained and seizure stopped as quickly as possible.	• Call for urgent help. • Turn him on his side, protect his head and clear the area. • Give high-flow oxygen; suction as needed. • Give the prescribed benzodiazepine and follow the status epilepticus protocol. • Check blood glucose.	• Goal reached when the seizure stops and SpO_2 rises.
Subjective *No specific complaint* **Objective** • Unresponsive • Rigid muscles	**ACTUAL** Ineffective breathing pattern related to muscle rigidity as evidenced by irregular breathing.	• Ventilation adequate, SpO_2 94% or above.	• Be ready to support the airway or intubate. • Keep SpO_2 and RR on continuous monitoring. • Give oxygen.	• Met when ventilation is adequate.
Subjective *No specific complaint* **Objective** • Prolonged seizure	**RISK** Risk for physical injury as evidenced by risk factors: uncontrolled motor activity.	• No injury during seizures.	• Pad the side rails. • Do not restrain his movements. • Note the onset, duration and type of seizure.	• Achieved if no injury occurs.
