8.1 Type 1 Diabetes Mellitus*

Assessment	Nursing Diagnosis	Plan / Expected Outcome	Nursing Interventions	Evaluation
Subjective • "I do not know how to inject insulin." • Newly diagnosed **Objective** • Blood glucose 280 mg/dL • HbA1c 10% • Cannot explain how insulin works	**ACTUAL** Inadequate health knowledge related to a new diagnosis and insulin therapy as evidenced by inability to describe or perform insulin injection.	• Before discharge, checks his own glucose and injects insulin correctly.	• Teach use of the glucose meter and how to keep a record. • Teach insulin types, timing and injection technique, with site rotation. • Teach how to store insulin. • Watch him repeat each step. • Teach sick-day rules: never omit insulin; test glucose and ketones more often.	• Met when he demonstrates correctly.
Subjective • "My glucose is sometimes very high, sometimes low." **Objective** • Readings 60–320 mg/dL over 3 days	**ACTUAL** Ineffective health self-management related to difficulty matching insulin, food and activity as evidenced by wide glycemic variability.	• Glucose on target for most of the day within 2 weeks.	• Go through the glucose log with him. • Teach carbohydrate awareness and regular mealtimes. • Teach how to adjust food or insulin before exercise, as the diabetes team advises. • Advise a glucose check before driving and at bedtime.	• Achieved when most readings are on target.
Subjective • "Sometimes I shake and sweat before lunch." **Objective** • On insulin • Irregular mealtimes	**RISK** Risk for ineffective blood glucose pattern self-management as evidenced by risk factors: insulin therapy, irregular meal pattern and limited experience with self-monitoring.	• Recognizes hypoglycemia and treats it correctly.	• Teach the signs of hypoglycemia. • Teach the treatment: 15 g of fast-acting glucose, recheck after 15 minutes. • Advise him always to carry glucose tablets and identification.	• Outcome reached when he describes the correct treatment.
