14.9 Multiple Organ Dysfunction Syndrome (MODS)

Assessment	Nursing Diagnosis	Plan / Expected Outcome	Nursing Interventions	Evaluation
Subjective • *No specific complaint* **Objective** • On a ventilator, FiO_2 0.7 • PaO_2 low • Bilateral infiltrates	**ACTUAL** **Impaired gas exchange** related to alveolar-capillary injury as evidenced by hypoxemia on high oxygen.	Oxygenation within the target the physician has set.	• Follow ABG and the ventilator settings. • Use lung-protective ventilation as ordered. • Position and prone him according to protocol. • Suction as needed.	Oxygenation on target: **goal met**.
Subjective • *No specific complaint* **Objective** • Urine output 10 mL/hour • Creatinine climbing • Fluid balance 4 L positive	**ACTUAL** **Excess fluid volume** related to acute kidney injury as evidenced by oliguria, rising creatinine and positive balance.	Fluid balance on target.	• Record urine output and fluid balance every hour. • Get ready for renal replacement therapy as ordered. • Follow electrolytes.	On target: **goal met**.
Subjective • *No specific complaint* **Objective** • Sedated • Immobile • Edematous	**RISK** **Risk for adult pressure injury** as evidenced by risk factors: immobility, edema and poor perfusion.	Skin stays intact.	• Change his position every 2 hours, as he tolerates. • Use pressure-redistributing surfaces. • Check the skin and the areas under devices every shift.	Skin intact: **goal met**.
