15.15 Induction of Labor

Assessment	Nursing Diagnosis	Plan / Expected Outcome	Nursing Interventions	Evaluation
Subjective • "Why do I need induction?" • "Will it hurt more?" **Objective** • Overdue, at 41 weeks • Cannot explain what will happen	**ACTUAL** **Deficient knowledge** related to the induction procedure as evidenced by questions.	Can say why she is being induced and what to expect.	• Explain the reason and the methods (prostaglandin, rupturing the membranes, oxytocin). • Explain the monitoring and how long it might take. • Get consent as policy requires.	Shows she understands: **goal met**.
Subjective • Gives contraction pain 7/10 **Objective** • Oxytocin infusion running • Contracting every 3 minutes	**ACTUAL** **Labor pain** related to induced uterine contractions as evidenced by pain score and contractions.	Copes with the contractions using the pain relief she has chosen.	• Go through the pain relief options with her. • Help her with breathing and positions. • Check her pain regularly.	Coping: **goal met**.
Subjective • *No specific complaint* **Objective** • On an oxytocin infusion	**RISK** **Risk for disturbed maternal-fetal dyad** as evidenced by risk factors: uterine hyperstimulation from oxytocin.	No more than 4–5 contractions in 10 minutes, and a normal fetal heart.	• Run oxytocin through an infusion pump and only increase it as the protocol allows. • Continuous monitoring of contractions and fetal heart. • If there is hyperstimulation or an abnormal fetal heart, stop the oxytocin and call the doctor.	Contractions and fetal heart normal: **goal met**.
