17.13 Acute Glomerulonephritis in Children

Assessment	Nursing Diagnosis	Plan / Expected Outcome	Nursing Interventions	Evaluation
Subjective • Mother says • "His urine is dark like tea." **Objective** • Blood in the urine • Puffy around the eyes • BP 130/90 mmHg • Passing little urine	**ACTUAL** **Excess fluid volume** related to reduced glomerular filtration as evidenced by edema, hypertension and oliguria.	Within 1 week, BP and urine output normal.	• Daily weight and a strict I&O chart. • Limit fluid and salt as prescribed. • BP every 4 hours. • Give the antihypertensive as ordered.	BP and output normal: **goal met**.
Subjective • Mother asks • "Can he eat normally?" **Objective** • Has questions about his diet • Cannot say what he should avoid	**ACTUAL** **Deficient knowledge (parent)** related to dietary restrictions as evidenced by questions.	Parent can describe the salt and fluid limits.	• Explain the salt and fluid limits. • Explain how recovery is expected to go.	Describes them: **goal met**.
Subjective • *No specific complaint* **Objective** • Hypertensive • BP 140/95 mmHg	**RISK** **Risk for ineffective cerebral tissue perfusion** as evidenced by risk factors: severe hypertension (encephalopathy).	No neurological complications.	• Report headache, vomiting, changes in vision or seizures. • Watch the BP.	No complication: **goal met**.
