4.13 Coronary Artery Bypass Graft (CABG)

Assessment	Nursing Diagnosis	Plan / Expected Outcome	Nursing Interventions	Evaluation
Subjective • Gives sternal pain 7/10 **Objective** • Guarding • Breathing shallow	**ACTUAL** **Acute pain** related to sternotomy as evidenced by pain score and shallow breathing.	Pain 3/10 or less and coughing effectively.	• Give analgesia regularly. • Teach him to hug a pillow against his chest when he coughs. • Encourage deep breathing and the incentive spirometer.	Pain controlled: **goal met**.
Subjective • *No specific complaint* **Objective** • Chest drains draining • BP low after surgery • Urine output low	**ACTUAL** **Decreased cardiac output** related to post-operative myocardial depression as evidenced by low BP and urine output.	MAP on target and urine output at least 0.5 mL/kg/hour.	• Follow hemodynamics, ECG and chest drain output. • Give fluids and inotropes as prescribed. • Watch potassium.	Hemodynamics stable: **goal met**.
Subjective • *No specific complaint* **Objective** • Wounds on the sternum and leg • Diabetic	**RISK** **Risk for surgical site infection** as evidenced by risk factors: sternotomy, leg graft site and diabetes.	Wounds heal without infection.	• Keep blood glucose under control as ordered. • Look at the wounds every day. • Teach sternal precautions (no heavy lifting, no pushing up with the arms).	Wounds healing: **goal met**.
