4.5 Heart Failure

Assessment	Nursing Diagnosis	Plan / Expected Outcome	Nursing Interventions	Evaluation
Subjective • "I wake up at night unable to breathe." **Objective** • Crackles at both bases • Edema in both legs • Put on 3 kg in 1 week	**ACTUAL** **Excess fluid volume** related to reduced cardiac pumping as evidenced by edema, crackles and weight gain.	Within 3 days the extra weight is coming off and the edema is less.	• Weigh every day before breakfast. • Keep a strict I&O chart. • Limit fluid and sodium as prescribed. • Give diuretics as ordered and watch potassium and creatinine. • Sit him upright.	Weight falling, less edema: **goal met**.
Subjective • "I get tired walking to the bathroom." **Objective** • Breathless with the smallest effort • HR goes up by 30/min with activity	**ACTUAL** **Activity intolerance** related to reduced cardiac output as evidenced by fatigue and dyspnea on exertion.	Within 1 week, manages his own care with breathlessness he can accept.	• Plan rest between activities. • Build up activity slowly. • Check HR, BP and SpO_2 while he is active.	Copes with self-care: **goal met**.
Subjective • "I do not weigh myself at home." **Objective** • Readmitted often	**RISK** **Risk for ineffective health self-management** as evidenced by risk factors: complex regimen and lack of self-monitoring.	Can say when he should call the doctor (for example a 2 kg weight gain in 3 days).	• Teach him to weigh himself every day and write it down. • Teach a low-salt diet and his fluid limit. • Teach the signs that his heart failure is getting worse.	Describes his self-monitoring plan: **goal met**.
