5.8 Status Epilepticus

Assessment	Nursing Diagnosis	Plan / Expected Outcome	Nursing Interventions	Evaluation
Subjective • *No specific complaint* **Objective** • Seizing non-stop for over 5 minutes • SpO_2 85% • Cyanosed	**ACTUAL** **Ineffective airway clearance** related to continuous seizure activity as evidenced by cyanosis and low SpO_2.	Airway kept open and the seizure stopped as quickly as possible.	• Call for urgent help. • Turn him on his side, protect his head and move things out of the way. • Give high-flow oxygen and suction as needed. • Give the benzodiazepine as prescribed and follow the seizure protocol. • Check the blood glucose.	Seizure over, SpO_2 back up: **goal met**.
Subjective • *No specific complaint* **Objective** • Unresponsive • Muscles rigid	**ACTUAL** **Ineffective breathing pattern** related to muscle rigidity as evidenced by irregular breathing.	Ventilation adequate with SpO_2 94% or more.	• Be ready to support the airway or intubate. • Continuous monitoring of SpO_2 and RR. • Give oxygen.	Ventilation adequate: **goal met**.
Subjective • *No specific complaint* **Objective** • Seizure going on for a long time	**RISK** **Risk for injury** as evidenced by risk factors: uncontrolled motor activity.	No injury during seizures.	• Pad the side rails. • Never hold his movements down. • Write down when the seizure started, how long it lasted and what type it was.	No injury: **goal met**.
