6.14 Colostomy and Ileostomy

Assessment	Nursing Diagnosis	Plan / Expected Outcome	Nursing Interventions	Evaluation
Subjective • "I do not want to look at it." • "My wife will be disgusted." **Objective** • Looks away during stoma care • Will not touch the bag	**ACTUAL** **Disturbed body image** related to stoma formation as evidenced by refusal to look at or touch the stoma.	Before discharge, looks at the stoma and joins in with its care.	• Let him talk about how he feels. • Bring him into his care one step at a time. • If he agrees, involve his wife. • Offer to put him in touch with a stoma support group or someone who has lived with a stoma.	Looks at and handles the stoma: **goal met**.
Subjective • "How do I change the bag?" **Objective** • Stoma is new • Cannot explain how to change the bag	**ACTUAL** **Deficient knowledge** related to stoma care as evidenced by questions and inability to describe care.	Before discharge, changes the appliance correctly by himself.	• Teach him to measure the stoma and cut the flange to fit. • Teach him to clean the skin with water and dry it before putting the bag on. • Teach him to empty the pouch when it is one-third full. • For an ileostomy: teach him to drink plenty and to know the signs of dehydration. • Teach what to report: a dark stoma, no output, bleeding.	Shows you correctly: **goal met**.
Subjective • *No specific complaint* **Objective** • Liquid output (ileostomy) • Bag does not fit well	**RISK** **Risk for impaired skin integrity** as evidenced by risk factors: contact of stoma output with skin.	Skin around the stoma stays intact.	• Check the flange fits every time it is changed. • Look at the skin around the stoma. • Use barrier products as recommended.	Skin intact: **goal met**.
