7.11 Benign Prostatic Hyperplasia and TURP

Assessment	Nursing Diagnosis	Plan / Expected Outcome	Nursing Interventions	Evaluation
Subjective • "I wake up 4 times at night to pass urine and the stream is weak." **Objective** • Stream weak, slow to start • Scan shows residual urine	**ACTUAL** **Impaired urinary elimination** related to bladder outlet obstruction as evidenced by hesitancy, weak stream and nocturia.	Empties his bladder properly after treatment.	• Chart his voiding pattern. • Give the alpha-blocker as prescribed. • Get him ready for TURP as ordered.	Voiding better: **goal met**.
Subjective • Bladder spasms since the operation **Objective** • Three-way catheter with continuous irrigation • Clots in the drainage	**ACTUAL** **Acute pain** related to bladder spasms after TURP as evidenced by reported spasms.	Says the spasms have eased.	• Run continuous bladder irrigation fast enough to keep the urine light pink. • Check the catheter is draining; if clots block it, irrigate as ordered. • Give the antispasmodic as prescribed. • Work out the true urine output (output minus irrigation).	Spasms gone, catheter draining: **goal met**.
Subjective • *No specific complaint* **Objective** • Prostate resected • Drainage light pink	**RISK** **Risk for bleeding** as evidenced by risk factors: prostatic surgery.	No significant bleeding.	• Watch the colour of the drainage. • Follow vital signs and Hb. • He should not strain.	No bleeding: **goal met**.
