7.5 Acute Kidney Injury

Assessment	Nursing Diagnosis	Plan / Expected Outcome	Nursing Interventions	Evaluation
Subjective • "I am passing very little urine." **Objective** • Only 15 mL/hour of urine for 6 hours • Creatinine going up • Crackles and edema	**ACTUAL** **Excess fluid volume** related to reduced renal excretion as evidenced by oliguria, edema and crackles.	Fluid balance achieved and weight stable.	• Record urine output every hour and keep a strict I&O chart. • Weigh every day. • Restrict fluids as prescribed (often the previous day's output plus insensible loss). • Go through his drugs with the physician and look for any that harm the kidneys. • If ordered, prepare for dialysis.	Fluid balance achieved: **goal met**.
Subjective • "I feel weak and my heart is jumping." **Objective** • Serum K^+ 6.4 mmol/L • Tall, peaked T waves on ECG	**ACTUAL** **Decreased cardiac output** related to hyperkalemia as evidenced by ECG changes.	Serum K^+ below 5.5 mmol/L and ECG back to normal.	• Continuous ECG monitoring. • Give calcium gluconate, insulin with glucose and any other treatment as prescribed. • Cut potassium in his diet. • Recheck potassium as ordered.	K^+ normal: **goal met**.
Subjective • *No specific complaint* **Objective** • Uremia • Has a central line and a urinary catheter	**RISK** **Risk for infection** as evidenced by risk factors: uremia and invasive devices.	No infection.	• Aseptic care of the lines and the catheter. • Watch temperature and WBC. • Take devices out as soon as they are not needed.	No infection: **goal met**.
