8.1 Type 1 Diabetes Mellitus

Assessment	Nursing Diagnosis	Plan / Expected Outcome	Nursing Interventions	Evaluation
Subjective • "I do not know how to inject insulin." • Just diagnosed **Objective** • Blood glucose 280 mg/dL • HbA1c 10% • Cannot explain how insulin works	**ACTUAL** **Deficient knowledge** related to new diagnosis and insulin therapy as evidenced by inability to describe or perform insulin injection.	Before discharge, tests her own glucose and injects insulin correctly.	• Teach her to use the glucose meter and keep a record. • Teach the insulin types, when to give them, and injection technique with site rotation. • Teach how to store insulin. • Watch her do it herself. • Teach the sick-day rules: never stop insulin, and check glucose and ketones more often.	Does it correctly: **goal met**.
Subjective • "My glucose is sometimes very high, sometimes low." **Objective** • Glucose 60–320 mg/dL over 3 days	**ACTUAL** **Ineffective health self-management** related to difficulty matching insulin, food and activity as evidenced by wide variation in blood glucose.	Within 2 weeks, glucose on target for most of the day.	• Go through her glucose log with her. • Teach her about carbohydrates and the need for regular meals. • Teach her to adjust food or insulin before exercise, as the diabetes team advises. • She should check her glucose before driving and at bedtime.	Most readings on target: **goal met**.
Subjective • "Sometimes I shake and sweat before lunch." **Objective** • On insulin • Eats at irregular times	**RISK** **Risk for unstable blood glucose level** as evidenced by risk factors: insulin therapy and irregular food intake.	Recognises a hypo and treats it correctly.	• Teach the signs of hypoglycemia. • Teach the treatment: 15 g of fast-acting glucose, then recheck after 15 minutes. • She should always carry glucose tablets and identification.	Describes the right treatment: **goal met**.
