17.14 Type 1 Diabetes in Children*

Assessment	Nursing Diagnosis	Plan / Expected Outcome	Nursing Interventions	Evaluation
Subjective • Mother asks, "How will we manage injections at school?" **Objective** • Newly diagnosed, aged 8 • Parents cannot describe insulin use	**ACTUAL** Inadequate health knowledge [parent and child] related to a new diagnosis of diabetes as evidenced by questioning.	• Parents test glucose and give insulin correctly; the child names the signs of hypoglycemia.	• Teach glucose testing and insulin injection. • Teach how to recognize and treat hypoglycemia. • Liaise with the school nurse or teacher. • Teach sick-day rules.	• Outcome reached when demonstrated correctly.
Subjective • Child says, "I do not want the needle." **Objective** • Cries at injections • Hides when insulin is prepared	**ACTUAL** Excessive fear related to repeated injections as evidenced by crying and refusal.	• Accepts injections with support.	• Use explanations and play that suit his age. • Offer choices, such as the injection site. • Praise him when he cooperates.	• Considered met when injections are accepted.
Subjective *No specific complaint* **Objective** • On insulin • Activity varies from day to day	**RISK** Risk for ineffective blood glucose pattern self-management as evidenced by risk factors: insulin therapy, variable activity and intake, and a newly learned family regimen.	• Blood glucose on target most of the time.	• Go through the glucose record with the family. • Adjust the plan with the diabetes team.	• Goal reached when readings are mostly on target.
